### Summary

- Adimab's high-throughput yeast-based platform enables rapid generation and characterization of high-affinity soluble TCR for use in pHLA-targeting therapeutics.
- Affinity maturation of a cancer-targeting TCR yielded variants with >30,000-fold improved affinities and far fewer mutations than a high-affinity clinical control.
- Library-derived high-affinity TCR variants exhibited highly specific peptide binding, with fewer human off-target interactions than a related clinical control.
- Library-derived high-affinity TCR variants potently induced target cell killing equivalent to a clinical control when reformatted into a clinically validated TCE format.

### Acknowledgements

We thank the members of Adimab's High Throughput Expression Yeast, Mammalian, and CORE teams for their contributions to this work.
